Microprocessor Design/Computer Architecture - Wikibooks ...

Definition: A microprocessor is nothing but the Central Processing Unit of a computer that has been constructed on a single chip. It is an integrated circuit and is able to implement all the important functions of the CPU. It is built on a silicon chip and is a clock-driven. The device is register-based.

Introduction of Microprocessor. A Microprocessor is an important part of a computer architecture without which you will not be able to perform anything on your computer. It is a programmable device that takes in input perform some arithmetic and logical operations over it and produce desired output. In simple words, a Microprocessor is a digital device on a chip which can fetch instruction from memory, decode and execute them and give results.

A microprocessor is a computer processor that incorporates the functions of a central processing unit on a single (or more) integrated circuit (IC) of MOSFET construction. The microprocessor is a multipurpose, clock -driven, register -based, digital integrated circuit that accepts binary data as input, processes it according to instructions stored in its memory , and provides results (also in binary form) as output.

After the request is completed, the control goes back to the main program. There are 5 interrupt signals in 8085 microprocessor: INTR, RST 7.5, RST 6.5, RST 5.5, TRAP.

Microprocessor - Overview - Tutorialspoint

A microprocessor (sometimes abbreviated μP) is a digital electronic component with transistors on a single semiconductor integrated circuit (IC). One or more microprocessors typically serve as a central processing unit (CPU) in a computer system or handheld device. Microprocessors made possible the advent of the microcomputer.

A Sun UltraSPARC, a RISC microprocessor. A reduced instruction set computer, or RISC (/ risk /), is a computer with a small, highly optimized set of instructions, rather than the more specialized set often found in other types of architecture, such as in a complex instruction set computer (CISC). The main distinguishing feature of RISC architecture is that the instruction set is optimized with a large number of registers and a highly regular instruction pipeline, allowing a low number of ...

Reduced instruction set computer - Wikipedia
The architecture is the programmer's view of a computer. It is defined by the instruction set (language) and operand locations (registers and memory). Many different architectures exist, such as ARM, x86, MIPS, SPARC, and PowerPC. The first step in understanding any computer architecture is to learn its language.
